What's an OS ?

- ❑ **Definition** : Software that controls the execution of programs and that may provide services such as resource allocation, scheduling, input/output control, and data management. Although operating systems are predominantly software, partial hardware implementations are possible.
-

Main Function of OS

- ☐ Convenience
 - ☐ Efficiency
-

Functions

- ☐ User Interface, e.g. GUI , command-line interface
 - ☐ Managing computer hardware
 - ☐ File system management
 - ☐ Supporting program creation and execution
 - ☐ System access
-

Conclusion

- ❑ OS is the manager between computer and human.

Classifications of OS

- ❑ *Interactive or batch*
 - *Typical OS these days can do both.*
 - ❑ *Multiprogramming or uniprogramming*
(Multitask or Unitask)
 - *Only multiprogramming OS's exist.*
 - ❑ *Multiuser or Single User*
 - *PC's OS tends to be single user, but Linux is multiuser.*
-

Batch multiprogramming vs. Time sharing

- Principal objective
 - Batch : maximize processor use
 - Time sharing : minimize response time
 - Source of directives
 - Batch : Job control language commands
 - Time sharing : commands entered at the terminal
-

Basic Components of an OS

- ☐ Interface
 - ☐ Scheduler (long-term scheduler)
 - ☐ Dispatcher (short-term scheduler)
 - ☐ Resource allocator
-

Scheduling

□ Types of scheduling

- Long-term scheduling: the decision to add to the pool of processes to be executed
 - Short-term scheduling: the decision as to which available process will be executed by the processor
 - I/O scheduling: the decision as to which process's pending I/O request shall be handled by an available I/O device
-

Long-term Scheduling

- ❑ Controls degree of multiprogramming
 - ❑ A job or user program -> process, added to the queue for the short-term scheduler
 - ❑ Criteria:
 - Priority
 - Approximated execution time
 - I/O requirement
-

Short-term scheduling

- ❑ Makes decision of which job to execute next
- ❑ Five-state process model

Short-term scheduling (2)

- ❑ Process control block :
information indicating the
state of the process and
other information
necessary for process
execution

Identifier
State
Priority
Program Counter
Memory Pointers
Context Data
I/O Status Information
Accounting Information

Scheduling Example

Key Elements of OS for Multiprogramming

Queuing diagram representation

Multiprogramming schemes

- ❑ Cooperative multiprogramming (Non-preemptive multiprogramming):
Windows, MacOS
 - ❑ Preemptive multiprogramming: UNIX,
Linux
-

Memory Management

- ❑ Maximizes the use of the processor by packing as many processes into memory as possible.
 - ❑ Two parts of Main memory: System (OS) + User
 - ❑ Memory management -> controls subdivision of "user" part of memory
-

Swapping

- ❑ Put processes in I/O queue into *Intermediate queue* and add a process from long-term queue

(a) Simple Job Scheduling

(b) Swapping

Partitioning

- ❑ Subdivide memory into small parts
- ❑ Methods:
 - Fixed-size partition
 - Variable-size partition

Operating System 128 K
64 K
192 K
256 K
384 K

Partitioning (2)

- ❑ Compaction: OS shifts the processes in memory to place all the free memory together in one block.

Paging

- ❑ Divide process into small fixed-size chunks -> *pages*
- ❑ Assign these chunks to chunks of memory -> *frames* (or *page frame*)
- ❑ OS must maintain the *page table*

Virtual memory

- ❑ Demand paging: each page of a process is read in only when needed, *on demand*.
 - ❑ Page Fault: the program uses an instruction or data on a page not in main memory.
 - ❑ *A process can be larger than all of main memory.*
 - ❑ Main memory=real memory, memory on the disk = ***virtual memory***
-

Segmentation

- ❑ Segmentation is visible to programmers.
 - ❑ Memory = multiple address spaces or segments
 - ❑ Segments are variable and dynamic.
 - ❑ Can create program segments and data segments
 - ❑ Each segment may be assigned access and usage rights.
-

Segmentation (2)

- ❑ Advantages:
 - Simplifies the handling of growing data structure
 - Allows programs to be altered and recompiled independently
 - Lends itself to sharing among processes
 - Lends itself to protection
 - ❑ Can be combined with Paging.
 - ❑ Modern processors support both mechanisms.
-

Segmentation (3)

Current OS's

- ❑ WINDOWS
 - ❑ Linux
 - ❑ MacOS
 - ❑ Others : UNIX(Solaris, HP-UX), iOS, Android, Symbian, etc.
 - ❑ Shares Estimates (%):
 - Desktop,laptop : Win 92.2 Mac 6.4 Lin 1.4
 - Tablets : iOS 57.6 Android 39.1
 - Servers : Lin 63.9 Win 36.1
 - Supercomputer : Lin 91.4 IBM 5.6
-
